### *Protecting air quality*

Local air quality is an important issue for the Blayney community. The issue was raised in our recent Community Consultative Committee meeting by neighbours who are concerned about levels of pollutants in the air, such as dust and other fine particles.

### *Meeting safety standards*

Every aspect of the Project will be required to meet the stringent health and safety standards set down by the NSW Government and the Environment Protection Authority (EPA).

Independent studies have also predicted that there will be no unsafe levels of dust or other pollutants as a result of the mine.

### *Continuous monitoring*

We've been studying local air quality since 2013, through a network of air quality and meteorology (weather) monitoring equipment installed at and around the mine site. They record:

1. weather and wind conditions;
2. levels of airborne dust/pollutants; and
3. levels of deposited dust.

Monitoring will continue 24/7 during construction and operations, providing continuous air quality information. This will be used to ensure that activities continue to comply with strict safety standards, providing peace of mind for neighbours and local landholders.

Most importantly, our site team, our neighbours and the surrounding community should not experience any health issues as a result of air quality impacts from the project.

Regards,
